

Unit Tests

Michael Farghali

November 4, 2015

So far I have tested that some of the tokens returned from `getToken` match what should be returned. The method `getLexeme` has also been tested to check that the string returned matches the string in the file. The `nextToken` method has been tested for valid and invalid results. The invalid tokens tested so far are as follows.

- `10e5e5` should return false
- `10.5.1` should return false
- case sensitive keywords `ELSE` instead of `else` should return false
- `10e++5` or `10e-5` should return false. Currently returns true
